Sprint:	TP2022T16 Sprint 8, TP2022T16 Sprint 9
Rank:	0 i000nz:

Description

User of the Viewer should be able to display PDF in standard formats

First step is to determine the format of the data input and convert it to format that our Viewer is capable of rendering

If the data is in a format that our Viewer does not support - make sure our Viewer component is wrapped in error boundary or try catch block, that catches the error - prevents App to crash and show a message that tells the user this format cannot be rendered.

Rank:	0 i000nr:

Description

Make sure to be able to pass a function - e.g. fetching single page into our Viewer. We want to make sure to be able to call external functions

Use case: User clicks on next page button in our Viewer - a function that fetches new page from backedn should be called (this is an external function) - after the fetch Promise with data is resolved, the data is passed to our Viewer, which responds to this change with rerendering

Description
Currently our built CSS bundle rewrites original styles of application, find a way to separate Viewer tailwind classes, e.g. prefix

Comments
Comment by <a href="#">Jakub Sorád</a> [ 15/Apr/23 ]
The state of this bug can be changed to DONE as the viewer demo now is on the separate domain so we don't need to resolve conflicts with Docosaurus webpages CSS and other things. It is accessible via our webpage by clicking "DEMO" and it redirects us to the new domain with the working demo.

Description

- navigate through document by sections of it/outlines/ table of contents
- create a button in taskbar to show clickable sections of document

Update 02/04/2022:

- table of contents is available (if PDF has outlines)
- navigating through sections is in W.I.P state. There are unresolved problems with pdfjs getDestination() function. Currently, when user clicks on the specific section it navigates him to hard coded page (navigating logic is implemented) .
- moving this task to the Sprint 8 to complete navigating to the correct page
