Description

User of the Viewer should be able to display PDF in standard formats

First step is to determine the format of the data input and convert it to format that our Viewer is capable of rendering

If the data is in a format that our Viewer does not support - make sure our Viewer component is wrapped in error boundary or try catch block, that catches the error - prevents App to crash and show a message that tells the user this format cannot be rendered.

Description

Make sure to be able to pass a function - e.g. fetching single page into our Viewer. We want to make sure to be able to call external functions

Use case: User clicks on next page button in our Viewer - a function that fetches new page from backedn should be called (this is an external function) - after the fetch Promise with data is resolved, the data is passed to our Viewer, which responds to this change with rerendering
